| Title of Invention | METHOD FOR VERIFYING SERVICE LOGIC PROGRAM OF<br>SERVICE CONTROL SYSTEM    |  |  |  |

**Abstract**

Abstract:

PURPOSE: A method for verifying a service logic program of a service control system is provided to test without other factors composing an actual intelligent network, in order to verify the service logic program of a service control system. CONSTITUTION: An apparatus for verifying a service logic program of a service control system consists of a service logic program execution part(301), an intelligent information providing system function processing part(304), a log file(305) and a comparison, analysis and verification part(303). The service logic program execution part(301) executes a service logic program based on a predetermined test data(302). The intelligent information providing system function processing part(304) processes operation

with the intelligent information system. The log file(305) is obtained as a result of the transmitting and receiving process of operation. The comparison, analysis and verification part(303) compares, analyzes and verifies the results of the test data and the log file.
